Task-2

Car Site

Day -1

Today I started with second task. With this I was getting confused to decide which landing page to create. Then I decided to create a landing page of car site. So, I started with creating layout of the page and functionalities to create. I started with creating basic files and folder structures and images folder.

Day -2

On second day I started with implementation of project. I created some basic head, body, div tags. After this I initialized classes and id's as per required tags and applied some basic stylings to the page.

→Today although I didn't face any error but took help of google and some basic sites for implementation.

Learning=From this I came to know about problem solving skills and if you stuck on any situation just try to relax and after taking break of some time then fresh start with the project.

Status: - Today only basic work is completed.

Day -3

On day 3 I started with using image tag for the project. For the project I used splash site for using images. This is the best site for the high-quality images. Also, for fonts I used Google fonts to style the page. Also for some few steps I took help of w3school and mdn documentation.

Learning= In project you need to do research for implementation.

Status= Today 25% of project is completed.

Day -4

Today I worked only on header section. All designing and styling done today. Also created nav bar. While setting the position I faced the main problem.

→While setting position in nav elements I was facing problem. So, to solve this error I took help of ChatGPT and Google's AI tool Gemini.

Learning= While using AI I came to know that its just tool but it can't replace the developers. So, you just need to develop the skills.

Status= Today main header section is completed and started with mid-section.

Day -5

On day 5 I started with the mid-section. For some point I used a site CodePen for reference and took some layout. CodePen is site which provide free templates for the projects.

→There is an AI tool Blackbox which is used to solve issues in code. So for some sort I used that tool.

Status= I worked on mid section for two days and after completion of two days maximum project is completed.

Day -6

On day 6 I started with footer section. Today I completed the project and just some code reviewing is remaining. On last day I mainly worked on footer section and animation on some parts where it is possible.

Learning=While working on this project I applied some new attributes, new measures (like vh, rvh, rem), practiced some different types of animation. After working on this I came to know that web development is to vast and you just need to study and improve your skills.
